GMB

1. About Vehicle Application

●Power Train System

2. Functions of the Clutch System

- Component cutting off the engine power from driving shaft when starting an engine or frequently shifting gears.
- It allows a slide when the power is conveyed by clutch so that the power can be dynamically controlled in slow/high speed, on a slope or on a downhill, facilitating smooth driving.
- In addition, the clutch system helps a vehicle start smoothly and advantageously reduce various noises and vibration occurred in power-train.

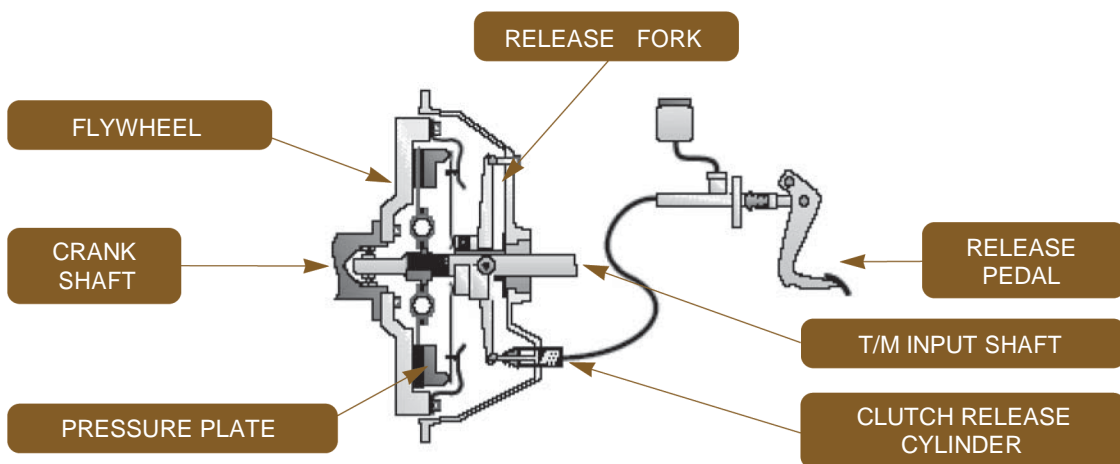

3. System Layout

● Structure of the Clutch Control System

➔ The clutch control system to operate clutch system consists of the following parts.

- CLUTCH PEDAL
- CLUTCH CABLE or CLUTCH RELEASE CYLINDER
- RELEASE FORK, and
- COMPENSATION SPRING.

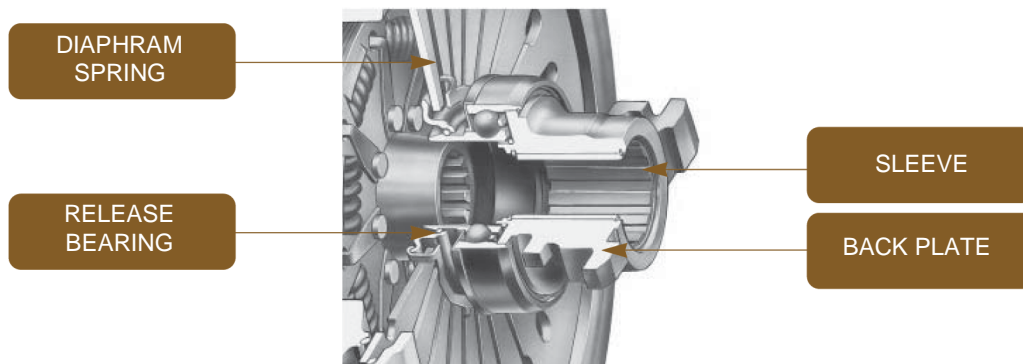

● Peripheral Parts of Clutch Release Bearing

- Sleeve

As the parts with sleeve to be assembled onto the input shaft, it is designed to adjust release bearing and automatic self centering bearing; there are two types; steel tub and plastic sleeve type.

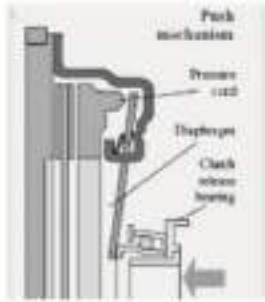

- Back Plate

Backplate on which the release bearing operation part of release fork are attached. In case of large commercial vehicles such as truck or bus, a type that fork is directly applicable to cast iron sleeve is also prepared.

4. System Operation

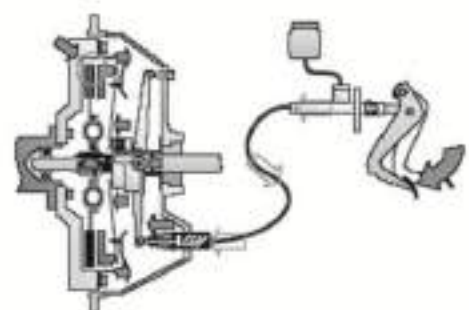

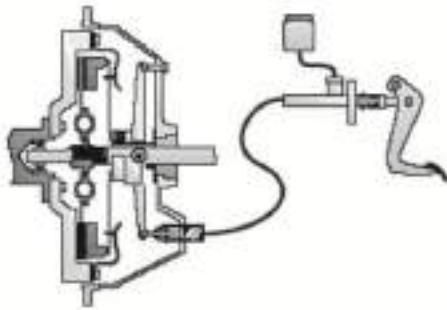

●Clutch Control System's Operation Mechanism [PUSH TYPE]

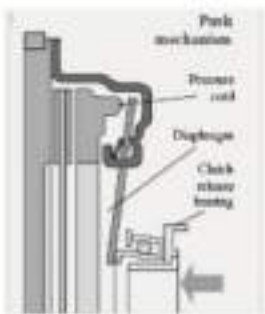

- Pedal operation → Hydraulic pump operation
- Pressure conveyed via hydraulic hose →
- Cylinder operation → Release Fork operation →
- RELEASE BEARING Movement →
- DIAPHRAGM transformation →
- PRESSURE PLATE non-contact →
- Power cut-off between engine and transmission

BEFORE OPERATION

AFTER OPERATION

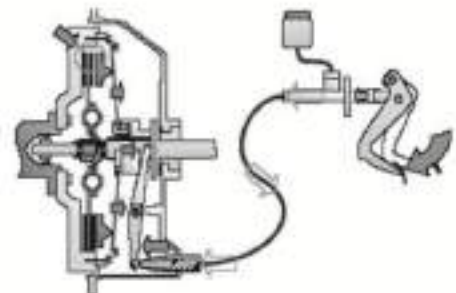

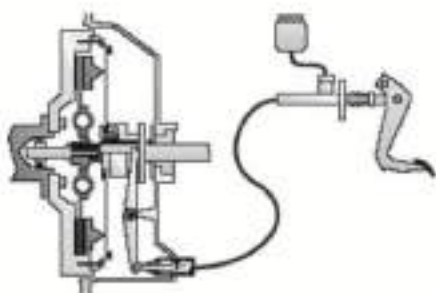

●Clutch Control System's Operation Mechanism [PULL TYPE]

- Pedal operation → Hydraulic pump operation →
- Pressure conveyed via hydraulic hose →
- Cylinder operation → Release Fork operation →
- RELEASE BEARING movement → DIAPHRAGM
- transformation → PRESSURE PLATE non-contact →
- Power cut-off between engine and transmission

BEFORE OPERATION

AFTER OPERATION

5. Self Centering

● Characteristics of the clutch release bearing

○ Self Centering

- Engine flywheel and sleeve are subject to eccentricity by the manufacturing tolerance.

When release bearing pushes D/Spring Finger Lever to control the coupling of the clutch, the eccentricity may generate a friction to bearing and finger part, probably causing excessive wear.

The self centering system of release bearing automatically adjusts the eccentricity when the clutch operates, avoiding the excessive wear on the clutch and bearing and improving the life span.

○ Self Centering Force

- Bearing for passenger car : 3 ~ 10 Kgf
- Bearing for commercial vehicle : 12inch (Φ330) : 10 ~18 Kgf
17inch (Φ430) : 20 ~35 Kgf

○ Auto Centering Force (F)

- $F = \mu \times P$ (Kg) [μ : friction coefficient, P : Spring force]
